

IDENTIFYING OBSTACLES IN BOCES SCHOOL DISTRICTS

Background:

- BOCES provides shared educational programs and services to school districts, reducing costs through a centralized ticketing system.
- Focus areas include the *Broome-Tioga* and *Maine-Endwell* regions.
- Service ticket analysis reveals issues like excessive transfers and seasonal workload spikes.
- Data-driven insights help improve efficiency, resource allocation, and service response times.

Policy Recommendations:

- Implementing a summer or winter operations plan that includes flexible staffing models
- Creating a redirection cheat sheet that lists common issues and which teams they would go to
- Using automation tools to reduce delays during predictable low-staff periods due to breaks
- Providing additional basic troubleshooting training for the Service Desk staff
- Having priority level escalate depending on X days open
- Implementing a transfer ticket alert that will notify a supervisor if a ticket is transferred more than two times to prevent repeated misrouting

Operational Highlights:

- Fast Initial Responses
- Higher Resolution Rates within Groups Compared to Last Year
- Clear Assignment Group Roles

Results

For both districts, Field Service team is the leading group for ticket transfers, serves as a central hub in the ticketing workflow

Ticket Transfer

Analysis

- Field Services handle diverse issues, some better suited for specialized teams.
- They receive more tickets than other groups, increasing transfer likelihood.
- Some tickets require teamwork with other groups, leading to more transfers.

Ticket Resolution

Both districts showed faster ticket resolution over time. Broome-Tioga had a big improvement after July 2023, while Maine-Endwell saw smaller ups and downs but also improved overall.

Factors that may contribute to spikes could be due to a lack of staff availability during the summer months, as school is not in session and many employees might be on leave or working reduced hours.

Comparison of Last Year's Redirection Count

In the previous dataset, only 46.89% of tickets were redirected once. In the current dataset, reveals that 45.76% of tickets were redirected once, maintaining a similar baseline.

There's been improvement in ticket routing within Broome-Tioga, reflecting enhanced categorization at intake, more accurate routing protocols, or clearer assignment group definitions.
